

Japanese Food Products are Safe and Reliable

- **The safety of Japanese food products is ensured through a food monitoring system and control measures applying stricter national standards than international safety standards (Codex guideline levels). In fact, through the monitoring of Japanese food products by the destination countries, there have been no case which exceeded the Japanese standards over 7 years.**
- **The measures and responses against radionuclide contamination of food are assessed as appropriate by international organisation (IAEA/FAO).**
- **The Government of Japan will ensure the safety of Japanese food products in accordance with the Basic Policy on handling of the ALPS (Advanced Liquid Processing System) treated water.**

* The basic policy selects discharge into the sea as the method of handling of the ALPS treated water. The actual discharge will be conducted in a way complying with the regulatory standards set based on international standards and subject to the approval of Nuclear Regulation Authority. To ensure the safety, the discharge will be reviewed by the IAEA.
